Description

The Quadrac is an internally triggered Triac designed for AC switching and phase control applications. It is a Triac and DIAC in a single package, which saves user expense by eliminating the need for separate Triac and DIAC components.

Q6008LTH1LED series is designed to meet low load current characteristics typical in LED lighting applications.

By keeping holding current at 6mA maximum, this Quadrac series is characterized and specified to perform best with LED loads. The Q6008LTH1LED series is best suited for LED dimming controls to obtain the lowest levels of light output with a minimum probability of flickering.

Q6008LTH1LED series is offered in the industry standard TO-220AB package with an isolated mounting tab that makes it best suited for adding an external heat sink.

Features

- As low as 6mA max holding current
- UL recognized TO-220AB package
- 110°C rated junction temperature
- di/dt performance of 70A/μs
- QUADRAC version includes intergrated DIAC
- RoHS compliant

Benefits

- Provides full control of light out put at the extreme low end of load conditions.
- 2500V_{AC} min isolation between mounting tab and active terminals
- Improves margin of safe operation with less heat sinking required
- Enable survivability of typically LED load operating characteristics
- Simplicity of circuit design & layout

Applications

Excellent for AC switching and phase control applications such as lighting and motor speed controls. Typical applications are AC solid-state switches, light dimmers with LED loads, small low current motor in power tools, and low current motors in home/brown goods appliances.

Internally constructed isolated package is offered for ease of heat sinking with highest isolation voltage.

Absolute Maximum Ratings

Symbol	Parameter		Value	Unit
$I_{T(RMS)}$	RMS forward current	$T_c = 80^\circ\text{C}$	8	A
I_{TSM}	Peak non-repetitive surge current	single half cycle; $f = 50\text{Hz}$; $T_J (\text{initial}) = 25^\circ\text{C}$	80	A
		single half cycle; $f = 60\text{Hz}$; $T_J (\text{initial}) = 25^\circ\text{C}$	85	
I^2t	I^2t value for fusing	$t_p = 8.3\text{ms}$	30	A^2s
di/dt	Critical rate-of-rise of on-state current	$f = 60\text{Hz}$; $T_J = 110^\circ\text{C}$	70	$\text{A}/\mu\text{s}$
I_{GM}	Peak gate current	$T_J = 110^\circ\text{C}$	1.5	A
T_{stg}	Storage temperature range		-40 to 150	$^\circ\text{C}$
T_J	Operating junction temperature range		-40 to 110	$^\circ\text{C}$

Electrical Characteristics ($T_J = 25^\circ\text{C}$, unless otherwise specified) – Alternistor Quadrac

Symbol	Test Conditions		Value	Unit
I_H	$I_T = 15\text{mA}$ (initial)	MAX.	6	mA
dv/dt	$V_D = V_{DRM}$; gate open; $T_J = 110^\circ\text{C}$	MIN.	50	$\text{V}/\mu\text{s}$
$dv/dt(c)$	$di/dt(c) = 0.54 \times I_{T(rms)} / \text{ms}$; $T_J = 110^\circ\text{C}$	MIN.	10	$\text{V}/\mu\text{s}$
t_{gt}	(note 1)	TYP.	3	μs

(1) Reference test circuit in figure 7 and waveform in figure 8; $C_T = 0.1\mu\text{F}$ with 0.1 μs rise time.

Trigger DIAC Specifications

Symbol	Test Conditions		Value	Unit
ΔV_{BO}	Breakover Voltage Symmetry	MAX.	3	V
V_{BO}	Breakover Voltage, forward and reverse	MIN.	33	V
		MAX.	43	
$[\Delta V_{\pm}]$	Dynamic Breakback Voltage, forward and reverse (note 1)	MIN.	5	V
I_{BO}	Peak Breakover Current	MAX.	25	μA
C_T	Trigger Firing Capacitance	MAX.	0.1	μF

(1) Reference test circuit in figure 7 and waveform in figure 8.

Static Characteristics

Symbol	Test Conditions		Value	Unit
V_{TM}	$I_T = 1.41 \times I_{T(rms)} \text{ A}$; $t_p = 380\mu\text{s}$		MAX.	V
I_{DRM} / I_{RRM}	V_{DRM} / V_{RRM}	$T_J = 25^\circ\text{C}$	10	μA
		$T_J = 110^\circ\text{C}$	500	

Thermal Resistances

Symbol	Parameter	Value	Unit
$R_{\theta(J-C)}$	Junction to case (AC)	2.8	$^\circ\text{C}/\text{W}$
$R_{\theta(J-A)}$	Junction to ambient	50	$^\circ\text{C}/\text{W}$

Soldering Parameters

Reflow Condition		Pb – Free assembly
Pre Heat	- Temperature Min ($T_{s(min)}$)	150°C
	- Temperature Max ($T_{s(max)}$)	200°C
	- Time (min to max) (t_s)	60 – 180 secs
Average ramp up rate (Liquidus Temp) (T_L) to peak		5°C/second max
$T_{s(max)}$ to T_L - Ramp-up Rate		5°C/second max
Reflow	- Temperature (T_L) (Liquidus)	217°C
	- Temperature (t_L)	60 – 150 seconds
Peak Temperature (T_p)		260°C $+0/-5$
Time within 5°C of actual peak Temperature (t_p)		20 – 40 seconds
Ramp-down Rate		5°C/second max
Time 25°C to peak Temperature (T_p)		8 minutes Max.
Do not exceed		280°C

Physical Specifications

Terminal Finish	1005 Matte Tin-plated
Body Material	UL Recognized epoxy meeting flammability classification 94v-0
Lead Material	Copper Alloy

Design Considerations

Careful selection of the correct device for the application's operating parameters and environment will go a long way toward extending the operating life of the Thyristor. Good design practice should limit the maximum continuous current through the main terminals to 75% of the device rating. Other ways to ensure long life for a power discrete semiconductor are proper heat sinking and selection of voltage ratings for worst case conditions. Overheating, overvoltage (including dv/dt), and surge currents are the main killers of semiconductors. Correct mounting, soldering, and forming of the leads also help protect against component damage.

Environmental Specifications

Test	Specifications and Conditions
High Temperature Voltage Blocking	MIL-STD-750: Method 1040, Condition A Rated V_{DRM} (VAC-peak), 110°C, 1008 hours
Temperature Cycling	MIL-STD-750: Method 1051 -40°C to 150°C, 15-minute dwell, 100 cycles
Biased Temperature & Humidity	EIA/JEDEC: JESD22-A101 320VDC, 85°C, 85%RH, 1008 hours
High Temp Storage	MIL-STD-750: Method 1031 150°C, 1008 hours
Low-Temp Storage	-40°C, 1008 hours
Resistance to Solder Heat	MIL-STD-750: Method 2031 260°C, 10 seconds
Solderability	ANSI/J-STD-002, Category 3, Test A
Lead Bend	MIL-STD-750: Method 2036, Condition E

Dimensions — TO-220AB (L-Package) — Isolated Mounting Tab

Note: Maximum torque to be applied to mounting tab is 8 in-lbs. (0.904 Nm).

Dimension	Inches		Millimeters	
	Min	Max	Min	Max
A	0.380	0.420	9.65	10.67
B	0.105	0.115	2.67	2.92

Application Note: Controlling LED Lighting Using Triacs and Quadacs

Light Emitting Diodes (LEDs) are fast becoming the most popular lighting option.

Industry forecasts anticipate the market will continue to expand at an annual rate of 20% from 2011 to 2016, with the greatest growth coming in the commercial and industrial lighting sectors.

As incandescent lamps have been made largely obsolete, given the U.S. government's mandate to save energy, they have frequently been replaced by LEDs due to their long life (typically 25,000 hrs.) and the ease of adapting them to many different socket and shape requirements. However, LED lighting control presents a few problems not encountered with incandescent lamps. For example, with much less current from the LED load, normal types of triacs may be challenged in terms of latching and holding current characteristics.

Triacs make up the heart of AC light dimming controls. Triacs used in dimmers have normally been characterized and specified for incandescent lamp loads, which have high current ratings for both steady-state conditions and initial high in-rush currents, as well as very high end-of-life surge current when a filament ruptures.

Because they are diodes, LEDs have much lower steady-state current than incandescent lamps, and their initial turn-on current can be much higher for a few microseconds of each half-cycle of AC line voltage. Therefore, a spike of current can be seen at the beginning of each AC half-cycle. **Figure 1** illustrates a typical spike of current. Typically, the current spike for an AC replacement lamp is 6–8 A peak; the steady-state follow current is less than 100 mA.

Figure 1

LED lamps for home lighting lamps might draw 7.5 W (A19 bulb–450 lumens) or higher, with a chandelier typically having from four to ten lamps. In contrast, a string of 50 decorative Christmas lights might draw only 4.8 W total. An LED flood lamp for a recessed ceiling fixture designed to replace a typical filament unit that produces 750 lumens consumes only 13 W (BR30) in contrast with the old filament unit, which normally draws 65 W.

Designing an AC circuit for controlling LED light output is very simple when using the new Q6008LH1LED or Q6012LH1LED Series Triacs because only a few components are required. All that is needed is a firing/triggering capacitor, a potentiometer, and a voltage breakover triggering device.

By using two inverse parallel sensitive gate silicon-controlled rectifiers (SCRs), S4X8ES1, as the voltage breakover triggering device, the controlling circuit can produce a wide range of light level outputs. Also, by using two inverse parallel sensitive gate SCRs as the triggering device, a low hysteresis control can be achieved because two SCRs form a full breakback trigger.

Figure 2 illustrates a circuit diagram for such a control that might be ideal for a recessed flood lamp (for example, a BR30 LED lamp), which can be dimmed to produce a low-level light output or turned up to nearly 180° full light output.

Figure 2

This circuit allows the lamp to turn on at nearly the full 180° on each AC half-cycle; in addition, the RC timed turn-on may be delayed to a small conduction angle on each half-cycle for very low light output. The Q60xxLH1LED Triac Series, with its low holding and latching current characteristics, allows the triac to remain on at very low current levels. Two inverse parallel sensitive gate SCRs (S4X8ES1) with their gates tied together produce a very low voltage triggering device with full breakback voltage, producing very low hysteresis. That allows the potentiometer to be set for a low conduction angle with turn-on being immediate when the line switch is turned off and on. For more information and an explanation of the hysteresis phenomenon, see Littelfuse Application Note AN1003: Phase Control Using Thyristors.

The circuit diagram in **Figure 3** improves upon older phase control/dimmer circuits that provided poor hysteresis. As **Figure 3** shows, with the addition of steering diodes around the C_1 firing capacitor, hysteresis may be eliminated, as presented in Littelfuse Application Note AN1003.

Figure 3

If a wide control range (full bright to very dim) and low hysteresis are not critical to the application, a simple variable light control may be designed using new Littelfuse Q6008LTH1LED or Q6012LTH1LED Series Quadrac devices. (A quadrac device is a special type of thyristor that combines a diac and a triac in a single package.) The circuit shown in

Figure 4 further reduces the component count by combining the diac triggering device and an alternistor triac in a single TO-220 isolated mounting tab package. This control circuit allows a little lower full turn-on voltage due to higher V_{BO} switching of the diac trigger device but offers a light dimming function that operates from 175° to <90° of each AC half-cycle.

Figure 4

Notes: Potentiometer is 250kΩ with built-in fixed end resistance of 3kΩ minimum. The quadrac device is QxxxxLTH1LED with more sensitive triac die (low gate and holding current characteristics). R_L is a minimum LED load of 10 W. V_C is the same as the triggering voltage of the built-in diac die.

LED lamp loads for AC circuits may be very simple like the one shown in **Figure 5** or there may be extra elements for DC refinements, such as a filtering capacitor. The presence of added elements will determine if the LED lamp load is dimmable. The simpler the LED lamp load, the more likely it is to be dimmable because filtering capacitors may increase the minimum DC current to a level that thyristor devices latch on with no varying AC current reduction below the minimum thyristor holding current.
